Verto Candidate Test Project Instructions

Take the attached artwork and build a home-page and Content Management System with it:

- Three PNG files are in the zip file which shows a home page of a new website. The three PNG files represent the three size variants – desktop, tablet, and mobile. This artwork should be used to guide the coding and images cut out where required.

- You must use the Foundation framework to build the responsive layouts. This is available from http://foundation.zurb.com/.

- The page structure should be **hand coded** in HTML & CSS, without the aid of any WYSIWYG editors. We recommend Visual Studio Community Edition which is free.

- All the text content should be held in a database (either MS SQL Server or Access) and displayed on the page using ASP.Net (with **C#**) and **web forms** (i.e. not MVC).

- The product categories along the bottom should be displayed using an asp:Repeater, and be coming from a database table.

- A small content management system should be built to allow for the editing of the content of this page.

- No tier-pages need producing, only the home page.

- Note that although the PNG for the desktop version is 1920px wide, the content area is only 1280px. So the content needs to sit at 1280px except for the top banner which is 100% width.
